Appendix B: Evaluation Activity Definitions ........................................................................ 24
I. Introduction

This report is the sixth evaluation and research plan prepared by the Center for Energy, Economic and Environmental Policy (CEEEP) since 2004. It sets out a proposed process for establishing and executing a detailed evaluation and research plan for New Jersey’s Clean Energy Program. The five previous plans issued by CEEEP include:

- The 2004-2005 Evaluation and Research Plan Phase 1 Report\(^1\) which set out general strategies to be employed in evaluating programs and identified evaluation activities with a high priority that should be initiated in 2005.
- The 2004-2005 Evaluation and Research Plan Phase 2 Report\(^2\) which identified specific evaluation and research activities proposed for 2005 for each program and a timeline for implementing the recommended activities.
- The 2006 Evaluation and Research Plan\(^3\) which identified specific evaluation and research activities proposed for 2006.
- The Draft 2007 Evaluation and Research Plan\(^4\) which identified specific evaluation and research activities proposed for 2007. This report was not publicly released.
- The 2010-2011 Evaluation and Research Plan\(^5\) which identified specific evaluation and research activities proposed for 2010 and 2011.

There have been three evaluation studies undertaken since the last Evaluation Plan, including:

- Energy Efficiency Market Potential: EnerNOC is currently conducting an EE market potential study that will be finalized in mid-August, with preliminary results in late June. The market potential study will cover the Residential, Commercial, and Industrial sectors and will include both natural gas and electricity. The finalized Market Potential study will help inform the upcoming CRA proceeding.
- Renewable Energy Market Potential: Navigant is currently conducting an RE market potential study that will also be finalized in mid-August. The market potential study is looking at on-shore wind, marine hydrokinetic, small hydropower, energy storage technologies, and fuel cells.
- Avoided Cost Assumptions: CEEEP has recently released draft Avoided Cost assumptions for electricity and natural gas (wholesale and retail), capacity,

environmental externalities (CO2), and line losses. The assumptions were sent to the EE Committee for comments. Rate Counsel and New Jersey Natural Gas submitted comments to CEEEP on June 20, which are currently being addressed.

Table 3 and Appendix A of this report includes a full list of previous evaluation plans and reports.

Also shaping the planning of evaluation activities are two major policy initiatives that may impact energy efficiency and renewable energy programs. These initiatives include:

- Tracking progress towards the five goals set out in the State Energy Master Plan dated June 2011, including:
  - Drive down the cost of energy for all customers
  - Promote a diverse portfolio of new, clean, in-State
  - Reward energy efficiency and energy conservation and reduce peak demand
  - Capitalize on emerging technologies for transportation and power production
  - Maintain support for the renewable energy portfolio standard of 22.5% of energy from renewable sources by 2021
- Streamlining the administration of the New Jersey Clean Energy Program by transitioning from management by three separate market managers to a single program administrator.

This evaluation plan was developed taking into consideration studies that will be needed to support these policy initiatives. For example, updating market potential studies will support the Board’s future funding level proceedings and the energy efficiency and process evaluations will support the new program administrator by determining the implementation, effectiveness, operational efficiency, and market actor satisfaction of the current programs.

Evaluation and research activities are intended to provide a continual feedback loop to policymakers, program administrators and program managers. This report summarizes evaluation activities recently completed or currently underway, identifies major issues facing the Board related to New Jersey’s Clean Energy Program and how the evaluation activities proposed in this and past plans will support the Board’s decision making process as it addresses these issues.

Several entities that are involved in the oversight, delivery, evaluation and management of New Jersey’s Clean Energy program will have a role in implementing this evaluation plan including:

- The Board of Public Utilities (the Board)
- The Office of Clean Energy (OCE)
- Rutgers Center for Energy, Economic and Environmental Policy (CEEEP)
- Applied Energy Group (AEG) in its current role as Program Coordinator
- Honeywell in its current role as the residential energy efficiency and renewable energy Market Manager
- TRC in its current role as C&I energy efficiency Market Manager
• The utilities in their role as manager of the New Jersey Economic Stimulus Plan energy efficiency programs and the Comfort Partners program
• Rate Counsel in its role of participating in the development of the evaluation plan, reviewing and commenting on draft evaluation plans and proposed modifications to the Protocols, and reviewing and commenting on evaluation reports
• Regional Partners, including Northeast Energy Efficiency Partnership and Consortium for Energy Efficiency, in their role of providing additional evaluation support at regional and national levels (if New Jersey chooses to renew its membership in the organizations), and
• Other stakeholders in their role of participating in and providing feedback on evaluation activities.

Please note that under the new program administration structure being developed by the BPU, the program coordinator and market manager roles will be combined into a single program administrator role. The specific role of each of these entities in implementing the evaluation plan is described more fully in Section VI below and is shown pictorially in Figure 1.

II. Purposes of Evaluation
New Jersey’s Clean Energy Program, one of the nation’s most ambitious energy efficiency and renewable energy initiatives, requires a significant commitment to

See Table 2 and Section IIIa for more details on evaluation activity responsibilities
transparent, accurate, and timely evaluation. The need for a commitment to evaluation is based on several factors, including:

- The need for regulatory accountability given the significant and increasing level of public funds dedicated to energy efficiency and renewable energy programs
- The need to track progress toward New Jersey’s goals as stated in the newly released Energy Master Plan
- The increased role of energy efficiency and renewable energy in deferring generation, transmission and distribution infrastructure upgrades
- The increased role of energy efficiency and renewable energy in meeting greenhouse gas goals
- The potential for incentive payments related to the successful implementation of energy efficiency and renewable energy programs
- The potential for efficiency savings and distributed renewables to be bid into the new PJM Reliability Pricing Market
- The need to ensure that energy efficiency and renewable energy programs are designed and administered to achieve the desired goals in a cost-effective manner.

Program evaluation can have a number of different purposes and can be either backward looking or forward looking. Both of these perspectives are valuable and important. Although the goals of evaluation can be articulated in a number of different ways, they generally fall under one of the following categories:

*Retrospective:*

- Quantifying the historical impacts of programs – in energy, environmental and/or economic terms – to assess whether goals have been achieved
- Assessing whether the performance of the organizations delivering programs were good enough to warrant payment of performance incentives (i.e. for achieving goals)

*Prospective:*

- Identifying keys to program successes and/or failures so that the program elements associated with such successes are continued, emphasized even more and/or applied to other initiatives where appropriate, and elements associated with failures are changed
- Assessing whether programs can be improved to be more effective – whether in attracting participants, obtaining more system savings, increasing participant satisfaction, and/or improving the efficiency of service delivery
- Assessing which historically pursued opportunities warrant continued attention and which do not (e.g. if the market is sufficiently transformed, or if new lower estimates of savings potential cannot justify market interventions)
- Identifying new opportunities for cost-effective savings
- Estimating the economic impacts of future initiatives to determine whether they should be pursued (i.e. whether the benefits exceed the costs)
• Establishing market benchmarks (e.g. market share for a particular efficient product) and/or performance indicators against which future program progress can be measured.

III. Types of Evaluation Activities

The main types of evaluation activities include:
• Cost Benefit Analysis
• Market Potential Studies
• Market Assessments
• Baseline Studies
• Impact Evaluations
• Process Evaluations
• Tracking System Assessments
• Protocols for Estimating Program Impacts

Table 1 shows the studies that have been conducted in New Jersey since 1999 and some of the anticipated studies from 2010 through 2012. For more details on these studies, see Table 2, Table 3, and Appendix A. A description of the various types of evaluations, and the evaluations suggested over the next few years, follows. More details on the proposed evaluations can be found in Section V.

Table 1: New Jersey Evaluation Timeline: 1999-2016

Completed Study             | Proposed Study             | EE = Energy Efficiency     |
| RE = Renewable Energy      |

Cost Benefit Analysis should assess the costs and benefits of individual programs and measures as well as the overall portfolio of programs. Costs should include both the costs of implementing the programs as well as any contributions made by participants or
others. Benefits should include both resource savings and environmental, health and other savings. CEEEP uses the cost tests described in the California Standard Practice Manual.\(^6\)

CEEEP has developed a cost-benefit model for estimating the costs and benefits of New Jersey’s Clean Energy Programs\(^7\). This tool has been used for calculating the costs and benefits of historic programs. In previous Evaluation Plans, there were three important tasks with regards to cost-benefit modeling that were recommended which did not occur. First, a process for developing OCE/BPU approval on inputs to the models such as avoided transmission and distribution costs, externalities, etc. should be developed. Second, a standardized cost-benefit test should be adopted in coordination with the OCE and codified. Finally, CEEEP should explore consideration of non-energy benefits such as increased comfort levels or increased home values that could result from measures installed under programs such as the Home Performance with Energy Star program. Additionally, CEEEP is working with Applied Energy Group and Honeywell to improve the reporting of relevant program measure data. Cost-benefit analyses have been conducted in 2004, 2005, and annually since 2008, and will be conducted annually from 2012 through 2016.

**Market potential studies** assess the technical, economic and market potential for energy efficiency and renewable energy measures. Technical potential is an estimate of the total level of energy efficiency or renewable energy resources available unrestrained by economics. Economic potential screens for available energy efficiency and renewable energy resources that are economically viable compared to other available alternatives, and, market potential estimates the realistic level of economic resources that can be developed taking into consideration other market factors. Market potential studies were conducted in 1999, 2004, and 2008, and both Energy Efficiency and Renewable Energy studies are currently underway. The next Market potential study should be conducted in 2016 before the next Office of Clean Energy funding cycle.

**Market assessments** address specified market attributes such as customer or market actor awareness and attitudes, market barriers to efficiency and/or renewable energy investments, product and service availability, common practice, prices, new products, and market share of energy efficient products and services. They can also provide insight into key aspects of program impacts, including estimated free rider and spillover effects. Market assessments should identify barriers to program participation and strategies to remove or reduce such barriers. Market assessments may also be necessary to estimate savings from programs such as the Energy Star Products program since these estimates rely on assessments of market penetration rates of different measures. Market assessments should be performed every three to five years to help gauge the success of the programs and to provide updated market information to inform changes to programs. For example, Honeywell and TRC incorporated some of the recommendations of the

---

assessments performed in July 2006 and March 2008 into their respective 2008 and 2009 programs.

**Baseline studies** are a type of market assessment that provide a snapshot in time of the state of a market. These studies define what the state of the market is at the beginning of a particular program as a means of comparison for future results. The last baseline studies were performed in New Jersey by the utilities in 2000. Summit Blue updated some baseline studies as part of the energy efficiency market assessment. The market potential study that EnerNOC is currently conducting will provide an estimated baseline for many measures (including lighting) in the Residential, Commercial, and Industrial sectors. It is important that New Jersey specific baselines be established, though, for future market potential studies. At the current time, baseline studies are being suggested in 2014 and 2015 for Residential HVAC, Residential New Construction, C&I New Construction, and Lighting Measures. Additionally, a Residential Appliance Saturation Survey and C&I Equipment Saturation Survey are being recommended. The BPU and CEEEP will re-examine the need for Baseline studies after the Market Potential study is finalized. In addition, the BPU is looking into renewing their Consortium for Energy Efficiency (CEE) membership which includes the opportunity to sponsor the annual Energy Star Awareness Survey. The survey may be useful in determining appliance saturations in New Jersey and eliminate the need for the Residential Appliance Saturation Survey and C&I Equipment Saturation Survey.

**Impact evaluations** support the measurement of energy savings, the amount and distribution of savings, and the appropriateness and comprehensiveness of measures. Impact evaluations test the assumptions used to estimate the level of energy savings or renewable energy delivered by the installation of various technologies. Impact analyses should employ industry-accepted methods of analysis that rely on well-developed engineering and statistical analysis techniques including the possibility of energy-use simulation models, multivariate regression models, and/or other analytic tools. In addition to leveraging data collected through the course of program implementation, the analyses may employ billing analysis, end-use metering, site visits, customer surveys, or other data development studies as needed. KEMA conducted a comprehensive impact evaluation for several programs in 2009, and studies for the remaining EE, RE, and EDA programs has been suggested for 2012 and 2013.

**Process evaluations** address implementation effectiveness, operational efficiency, and customer and market actor satisfaction, attitudes, and awareness related to specified programs. Process evaluations also seek to find ways to improve the efficiency of the delivery of programs and to identify critical road blocks and opportunities to increase the availability of efficient measures and qualified trade allies to support customer adoption. A renewable energy process evaluation was conducted in 2004. Several process evaluations are being recommended for 2014/2015 after the new Program Administrator is selected so they can participate in discussions on the best way to frame these evaluations to help in program planning.
Tracking system assessments review the tracking systems to ensure consistent tracking and reporting, and collection of all necessary data. This step is critical in determining what level of detail is available for all other analyses related to the established programs. Stakeholders should have an opportunity to provide feedback on what data is necessary and data should be available for the public to evaluate and use taking into consideration protection of confidential customer information. A tracking system assessment of the Information Management System is recommended for 2012/2013 to assess the collection of data and ensure consistent tracking and reporting of program data.

Protocols are used in New Jersey to estimate program savings. The Protocols use measured and customer data as input values into measure specific algorithms. The savings algorithms for NJCEP are a combination of results from various impact evaluations (primarily in the Northeast) and engineering estimates of savings that have been developed based on manufacturer data, program monitoring and evaluation data, and information from other programs. The data and input values for the protocol algorithms come from the program application forms and tracking systems, or from standard values. These Protocols are updated and approved by the Board on an annual basis.

Surveys and focus groups are conducted to determine the perceptions of, and interest in, current and new programs. These studies have several major uses including:

- Aid in program design by measuring customer receptiveness to alternative program designs/attributes and identifying roadblocks to participation.
- Aid in communication planning by measuring customer preferences for various media, methods of communication, and value propositions.
- Understand the effectiveness - strengths and weaknesses - of New Jersey's efforts to date to increase consumer awareness, interest, and participation.
- Track some of the key perceptions measured in prior surveys in order to measure changes in awareness, media/communications preferences, interest, attitudes, and behaviors relevant to energy efficiency, clean power, and the State's programs designed to promote them.
- Understand more fully consumers' multiple motivations for getting involved with energy efficiency and clean energy.

Surveys and focus groups were alternated for Residential and Business programs each year in the past, but have not been conducted since 2008.

IV. Previous and Recurring Evaluation Activities

This section of the evaluation plan highlights the evaluation studies performed since 1999 and discusses major evaluation activities that will be performed annually. Table 2 shows a timeline of evaluation studies that have been completed from 1999 through July 2012. Links to these studies can be found in Appendix A.

</table>
In addition to the major evaluation studies that are undertaken every few years or as they are needed, there are several types of studies that occur on an annual basis. These studies include:

Update Evaluation Plan
This evaluation plan should be updated annually as part of the program and budget planning process. The current process results in the Program Managers and the OCE submitting a compliance filing by October 1 each year that includes program descriptions and budgets for the proposed programs to be implemented in the following calendar year. An updated evaluation plan that identifies the major evaluation activities proposed for the following year and budgets necessary to perform those activities should be submitted coincident with the compliance filings.

CEEEP will coordinate with the OCE and Program Administrators to develop the annual evaluation plan. Draft plans should be presented to the Clean Energy Council and its committees for comment prior to submitting a final plan to the OCE. The evaluation plan will describe major evaluation activities proposed for the following year, identify the entity responsible for implementing each component of the plan and proposed budgets for performing the evaluation activities.

Update Protocols
The current New Jersey Clean Energy Protocols to Measure Resource Savings (the Protocols) were approved by the Board in September 2011. The Protocols were developed to measure resource savings, including energy, capacity, and other resource savings. The Protocols are also used in determining energy and cost savings associated with the Energy Savings Improvement Program.

The Protocols should be updated annually or as new programs or measures are added, coincident with the Board’s approval of annual program plans and budgets. Compliance filings submitted by any program manager should include proposed protocols for any new programs or program components.

The Program Administrator shall include any proposed modifications to the Protocols as part of their compliance filings due by October 1 each year. Currently, AEG compiles the proposed changes to the Protocols and prepares a redlined version that includes all of the proposed changes. AEG circulates the proposed changes for comment, review and assess the comments, and prepare a final draft for submittal to the OCE for consideration by the Board.

AEG will coordinate with the OCE to prepare documents required for consideration by the Board of any proposed changes to the Protocols and will submit proposed changes to the Protocols to the OCE for consideration by the Board by December 1 each year.

**Cost Benefit Analysis**

Cost benefit analysis should assess the costs and benefits of individual programs and measures as well as the overall portfolio of programs. Costs should include both the costs of implementing the programs as well as any contributions made by participants or others. Benefits should include both resource savings and environmental, health and other savings as deemed appropriate and documented with supporting justification. In addition, rate and bill impact analyses should be performed. The cost benefit analysis should take a multi-year view of the programs taking into consideration that new programs may have high start up costs.

CEEEP believes that the Board should formally approve the methodology to be used to assess the costs and benefits of the programs. CEEEP will work with the Office of Clean Energy and the Clean Energy Council to facilitate a coordinated review of proposed cost benefit analysis methodologies and develop recommendations for consideration by the Board.

CEEEP’s approach to cost-benefit analysis is very quantitative and, in general, does not take into account qualitative characteristics of the various programs and measures. The model simply measures how a program or measure’s costs relate to its benefits. The model is very dependent on quality information from the program implementers who propose various programs and measures. Program implementers will be asked to complete a small spreadsheet of requested information that will become input for the model.

The model is a fairly simple input-output model where a portion of the inputs come from program administrators (electricity savings estimates, tax credits, etc), a portion of inputs come from data sources such as PJM or EIA (electricity or natural gas prices), and a portion of the inputs come from CEEEP (discount rate, transmission and distribution costs, etc.). The model takes these inputs and produces specific outputs such as emission savings, program participant benefits, participant costs, etc.

CEEEP will perform cost-benefit analyses on both completed and proposed energy efficiency programs. The purpose of performing the analysis on completed programs is to determine how cost-effective the programs were to determine if the programs should be continued in the future. The purpose of performing the analyses on proposed programs is to project how cost-effective the proposed programs are and to have a common point of comparison to compare the various programs and measures.

CEEEP will perform a cost benefit analysis of the programs by August 31 each year.

**V. Proposed Evaluation Activities**

The proposed evaluation activities for 2010 and 2011 are described below and are summarized in Table 3.
### Table 3: Proposed New Jersey Evaluation Studies (2012-2016)

**2012/2013**

**Impact Evaluations**
- Home Performance with Energy Star
- Local Government Energy Audit
- Pay for Performance
- Direct Install
- EE products (Appliance Recycling, Washers, etc)
- Comfort Partners
- EDA Programs
- Sustainable Jersey
- Renewable Energy Incentive Program
- SREC Registration Program
- Grid Supply

**Process Evaluations**
- Tracking System Assessment (IMS)

**2014/2015**

**Baseline Studies**
- CEE Energy Star Awareness Survey (May replace saturation surveys)
- Residential HVAC
- Residential New Construction
- C&I New Construction

**Process Evaluations**
- SmartStart
- Pay for Performance
- C&I New Construction and Retrofit
- Home Performance with Energy Star
- Residential HVAC
- Direct Install

**2016**

- Market Potential Study
- CRA Proceeding for 2017-2020

### a. 2012/2013 Evaluation Activities

**Impact Evaluations:**
Impact Evaluations on the Combined Heat and Power, Residential HVAC, Residential New Construction, Residential CFL, SmartStart (C&I), and Customer On-Site Renewable Energy Program were performed in July 2009. The following impact evaluations are recommended over the next 12-18 months:

- Home Performance with Energy Star
- Local Government Energy Audit
- Pay for Performance
- Direct Install
- EE Products (Washers, Appliance Recycling)
- Combined Heat and Power
- Economic Development Authority CEP Programs
- Sustainable Jersey
- Renewable Energy Incentive Program
- SREC Registration Program
- Grid Supply Program

These impact evaluations would assess program energy savings impacts in order to assess the effectiveness on the programs and would calibrate savings assumptions associated with the various incentive programs. In the case of the Home Performance with Energy Star study, actual energy bill savings from program participants would be evaluated.

**Tracking System Assessment:**

A Tracking System Assessment of the NJCEP Information Management System (IMS) is necessary to assess the collection of data and ensure consistent tracking and reporting of program data. The study will determine if the proper data is being collected through IMS. In addition, a potential second phase of the study will investigate any potential challenges to using IMS for a financing-based program.

**b. 2014/2015 Evaluation Activities**

**Baseline Studies:**

There are several baseline studies that should be considered before the next CRA proceeding to inform the next market potential study. The market potential study that EnerNOC is currently conducting will provide an estimated baseline for many measures (including lighting) in the Residential, Commercial, and Industrial sectors. It is important that New Jersey specific baselines be established, though, for future market potential studies. There are several baseline studies that were recommended in the 2010 Evaluation plan and by Rate Counsel, that should be considered in 2014/2015:

- Residential Appliance Saturation Survey
- Residential HVAC
- Residential New Construction
- C&I Equipment Saturation Survey
- C&I New Construction
- Lighting Measures (both Residential and C&I)

The BPU and CEEEP will re-examine the need for Baseline studies after the Market Potential study is finalized. In addition, the BPU is looking into renewing their Consortium for Energy Efficiency (CEE) membership which includes the opportunity to sponsor the annual Energy Star Awareness Survey. The survey may be useful in determining appliance saturations in New Jersey and eliminate the need for the Residential Appliance Saturation Survey and C&I Equipment Saturation Survey.

**Process Evaluations:**

No process evaluations have been performed on the Energy Efficiency programs since the program inception in 1999. A process evaluation of all the energy efficiency programs is needed to determine the implementation, effectiveness, operational efficiency, and market actor satisfaction. In particular, the following Process Evaluations have been recommended in the 2010 Evaluation Plan and by Rate Counsel:

- SmartStart Buildings
- Pay for Performance (New Construction and Existing)
- C&I New Construction and Retrofit
- Home Performance with Energy Star
- Residential HVAC

The BPU will wait for the new Program Administrator to be selected so they can participate in discussions on the best way to frame these evaluations to help in program planning.

c. 2016 Evaluation Activities

**Market Potential:**

This study should provide an updated assessment of cost-effective, achievable energy efficiency and renewable energy potential. It should look not just at existing measures, but at emerging technologies, the potential implications of a “smart grid” on consumers ability to better manage energy use and the application of distributed renewables, and the potential for significant future penetrations of plug-in hybrid vehicles (e.g. could there be a future DSM program promoting the most efficient plug-ins).

As in the past, this study would be a key input to a 2016 BPU decision on the next 4-year funding cycle for the clean energy initiative.
VI. Responsibilities for Performing Evaluation Activities

Several entities that are involved in the oversight, delivery, evaluation and management of New Jersey’s Clean Energy program will have a role in implementing this evaluation plan including:

- The Board of Public Utilities (the Board)
- The Office of Clean Energy (OCE)
- Rutgers Center for Energy, Economic and Environmental Policy (CEEEP)
- Applied Energy Group (AEG) in its role as Program Coordinator, and
- Program Managers (currently Honeywell, TRC, and the utilities)
- Rate Counsel
- Other Stakeholders

This section will discuss the respective roles of each of these entities in developing, approving and implementing this evaluation plan. Table 4 provides an overview of the responsibilities of each party involved in evaluation. Please note that all roles in this section assume the current program structure, not the proposed structure which would establish a single program administrator.

| Table 4: Evaluation Activity Responsibilities (Under Current Program Structure) |
|-----------------|-----------------|-----------------|-----------------|-----------------|
| **Overall Responsibility** | **Evaluation Plans** | **Evaluation Contracting** | **Measurement & Analysis** | **Regional Initiatives** |
| Board | Sets overall program goals | Approves budgets and plans annually | Releases RFP's and approves contractors | Approves Protocols |
| OCE | Oversees all evaluation activities | Make evaluation plan and budget recommendations to Board | Reviews and approves RFP's before submitting to Board, Helps evaluate proposals and select contractors, designates contract manager | Makes recommendations on Protocols |
| CEEEP | Provides overall program evaluation services | Prepare & manage plans, determine evaluation study need and budget | Prepare RFP, evaluate proposals, manage contractors, track results | Perform CBA's, update avoided cost estimates |
| AEG | Supports evaluation activities | Assist in development of plans and budgets | Prepare RFP’s and manage day-to-day activities of contractors | Review and provide CBA input, update Protocols |
| Program Managers (Honeywell, TRC, Utilities) | Provide input on program goals, customers of evaluation studies | provide input on priorities & budgets, review evaluation plans | Assist in scope of works and contractor selection, provide input on data collection instruments, provide needed program data | Make recommendations on policy issues related to evaluation activities, Utilities provide supporting data and usage data |
| Rate Counsel | Review and comment on evaluation documents | Assist in development of plan, Provide feedback | Review and comment on evaluation papers | Review and comment on Protocols |
| Evaluation Study Consultants | Perform major evaluation studies | | Carry out measurement and analysis as necessary for studies | Perform studies on a regional or national level |
The Board
The Board approves program budgets and plans on an annual basis. As part of the annual program and budget approval process the OCE will submit proposed evaluation budgets and activities to the Board for consideration. The Board authorizes the release of RFPs for evaluation services and approves the selection of contractors to provide evaluation services. The Board approves the protocols used for estimating energy savings.

The OCE
The OCE oversees all evaluation activities including:
- Development of evaluation plans and budgets and preparing recommendations for consideration by the Board
- Review and approval of RFPs for evaluation services prior to submitting to the Board for approval
- Participate as a member of any team put together to evaluate proposals submitted and to select evaluation contractors
- The OCE designates a Contract Manager for each evaluation contractor that has responsibility for reviewing and approving all invoices and any final reports
- Making recommendations on Protocols

CEEEP
CEEEP has entered into a multi-year Memorandum of Understanding (MOU) with the Board to provide program evaluation services. As set out in the MOU, CEEEP is responsible for formal evaluation of the effectiveness of the programs. CEEEP has overall responsibility for managing evaluation activities including:
- Preparation of annual and multi-year evaluation plans
- Managing the implementation of the plans
- Performing cost benefit analyses and updating avoided cost estimates used to perform cost benefit analysis
- Managing Market Potential Studies, Baseline Studies, Market Assessments (except R&D activities as note below), Process Evaluations, and Impact Evaluations. For each of these types of evaluations CEEEP will:
  - Develop sections of the annual evaluation plan indicating when these types of evaluations should be performed and any specific issues the evaluation will assess
  - Coordinate with the Program Coordinator to ensure that the annual budgets approved by the Board include funding for any recommended evaluation activities
  - Determine whether the evaluations can be performed in-house at Rutgers or if an RFP will be issued for an outside contractor
  - Assist with the preparation of RFPs
  - Either issue the RFP or coordinate with AEG if the RFP is to be issued by Treasury
  - Participate on the team that evaluates any proposals received in response to RFPs
  - Review any draft reports issued by evaluation contractors
- Track implementation of recommendations included in evaluation reports
- Monitor national and regional evaluation activities including NEEP, CESA and CEE
  - Participate as a member of evaluation committees
  - Provide OCE with periodic reports concerning activities
  - Provide recommendations regarding benefits of continuing support for these activities
  - Identify national and regional evaluation activities that can support NJ’s evaluation efforts. Such activities should be specifically identified in the annual evaluation plan.

**Program Coordinator (AEG)**
In its role as Program Coordinator, AEG will support evaluation activities as follows:
- Assist in the development of annual and multi-year evaluation plans
- Assist in drafting the scope of work for evaluation RFPs
- Coordinate the development of annual evaluation plans with the development of annual programs and budgets for consideration by the Board
- Manage day-to-day activities of selected outside evaluation contractors including:
  - Assist with the collection of data needed to perform evaluations
  - Review of draft and final reports
  - Ensuring work is performed in accordance with work plans and on schedule
  - Provide recommendations regarding payment of invoices
  - Provide OCE with updates regarding status of evaluation projects
  - Coordinate approval of work plans, invoices, final reports and other documents with the designated BPU Contract Manager
- Coordinate with CEEEP and program managers regarding implementation of recommendations
- Maintaining and updating the Protocols for Measuring Resource Savings
- Review and provide input into cost benefit analyses
- Coordinate with CEEEP and the program managers to develop proposed revisions to protocols, coordinate soliciting comments on proposed changes and coordinate with OCE to develop draft Board Orders and present proposed changes to the protocols to the Board for consideration

**Program Managers (Honeywell, TRC, Utilities)**
The Program Managers are responsible for supporting formal evaluation activities in the following ways:
- Providing input to OCE, the Program Coordinator, and CEEEP on evaluation plans, priorities and budgets, based both on their experience and needs delivering programs in New Jersey and their awareness of leading evaluation efforts in other jurisdictions across the continent;
- Providing input on the scopes of work for prioritized studies that will be undertaken;
- Providing input on the selection of evaluation contractors when appropriate (e.g. more so for market assessments, not for impact evaluations);
• Reviewing and providing input on draft evaluation surveys or other data collection instruments;
• Supporting evaluation contractors, CEEEP and/or AEG in accessing program data necessary for evaluation studies;
• Reviewing and providing input on draft evaluation reports; and
• Making recommendations to OCE, AEG, and CEEEP on policies issues related to evaluation activities (e.g. how cost-effectiveness tests should be applied to measure or program screening).

Though not a formal evaluation activity, Program Managers have an on-going responsibility to continually re-assess their operations and programs based on informal market feedback. They also may lead research and development activities (once approved by the OCE), including the hiring of contractors to carry out such work. Finally, they are also obvious “customers” for the more formal evaluation work to be managed by CEEEP. All of that information – from informal market feedback, R&D work and formal evaluation studies – should inform the Program Managers in carrying out of their program design responsibilities.

Evaluation Plans

Evaluation Studies

Appendix B: Evaluation Activity Definitions

The following definitions of evaluation activities are included in the Glossary of Terms and Acronyms prepared for the Regional Evaluation, Measurement and Verification Forum\(^9\) that are applicable to the evaluation activities described in this report:

**Achievable Potential** - The amount of energy or demand savings within a defined geographical area or population that can be achieved in response to specific energy efficiency program designs, delivery approaches, program funding, and measure incentive levels. Achievable potential studies are sometimes referred to as Market Potential studies.

**Avoided Costs** - In the context of energy efficiency, these are the costs that are avoided by the implementation of an energy efficiency measure, program, or practice. Such costs are used in benefit cost analyses of energy efficiency measures and programs. Because efficiency activity reduces the need for electric generation, these costs include those associated with the cost of electric generation, transmission, distribution, and reliability. Typically, costs associated with avoided energy and capacity are calculated. Other costs avoided by the efficiency activity can also be included, among them the value of avoided emissions not already embedded in the generation cost, impact of the demand reduction on the overall market price for electricity, avoided fuel or water, etc. For natural gas efficiency programs, avoided costs include components of the production, transportation, storage, and service that are variable to the amount of natural gas delivered to customers.

**Baseline** - Conditions, including energy consumption and related emissions that would have occurred without implementation of the subject measure or project. Baseline conditions are sometimes referred to as “business-as-usual” conditions and are used to calculate program related efficiency or emissions savings. Baselines can be defined as either project-specific baselines or performance standard baselines (e.g. building codes).

**Baseline Data** - The baseline conditions of the facilities, market segment, generating equipment, or other area of focus of the subject project or program.

**Benchmarking** - A process that compares the energy, emissions, and other resource-related conditions of a facility against industry best practices.

**Benefit-Cost Ratio** - The mathematical relationship between the benefits and costs associated with the implementation of energy efficiency measures, programs, practices, or emissions reductions. The benefits and costs are typically expressed in dollars. Also see Benefit Cost Test and Avoided Cost.

---

**Benefit Cost Test** - Also called Cost-Effectiveness Test. The methodology used to compare the benefits of an investment with the costs. Five key benefit-cost tests have, with minor updates, been used for over 20 years as the principal approaches for energy efficiency program evaluation. These five cost-effectiveness tests are the participant cost test (PCT), the utility/program administrator cost test (PACT), the ratepayer impact measure test (RIM), the total resource cost test (TRC), and the societal cost test (SCT).

**Cost-Benefit and Cost-Effectiveness Analysis** - Analysis that compares the benefits associated with a program or measure’s outputs or outcomes with the costs (resources expended) to produce them. Cost-benefit analysis is typically conducted to determine the relationship of the program’s benefits and costs, as a ratio, once the decision has been made to implement or design the program; programs with benefit-cost ratios greater than 1.0 provide overall ratepayer benefits. Cost-effectiveness analysis is generally undertaken to compare one program or program approach to other approaches, or options for the use of funds, to determine the relationship among the options. The terms are often interchanged in evaluation discussions.

**Cost-Effectiveness** - An indicator of the relative performance or economic attractiveness of any energy efficiency investment or practice. In the energy efficiency field, the present value of the estimated benefits produced by an energy efficiency program is compared to the estimated total costs to determine if the proposed investment or measure is desirable from a variety of perspectives (e.g. whether the estimated benefits exceed the estimated costs from a societal perspective).

**Economic Potential** - The amount of savings opportunities that can be acquired cost-effectively.

**Evaluation** - The conduct of any of a wide range of assessment studies and other activities aimed at determining the effects of a program, understanding or documenting program performance, program or program-related markets and market operations, program-induced changes in energy efficiency markets, levels of demand or energy savings, or program cost effectiveness. Market assessment, monitoring and evaluation (M&E), and measurement and verification (M&V) are aspects of evaluation.

**Impact Evaluation** - An evaluation of the program-specific directly induced quantitative changes (e.g. kWh, kW, and therms) attributable to an energy efficiency program.

**Market Assessment** - An analysis that provides an assessment of how and how well a specific market or market segment is functioning with respect to the definition of well-functioning markets or with respect to other specific policy objectives. Generally includes a characterization or description of the specific market or market segments, including a description of the types and number of buyers and sellers in the market, the key actors that influence the market, the type and number of transactions that occur on an annual basis, and the extent to which market participants consider energy efficiency as an important part of these transactions. This analysis may also include an assessment of whether a market has been sufficiently transformed to justify a reduction or elimination...
of specific program interventions. Market assessment can be blended with strategic planning analysis to produce recommended program designs or budgets. One particular kind of market assessment effort is a baseline study, or the characterization of a market before the commencement of a specific intervention in the market, for the purpose of guiding the intervention and/or assessing its effectiveness later.

**Net-to-Gross Ratio (NTGR)** - A factor representing net program savings divided by gross program savings that is applied to gross program impacts to convert them into net program load impacts. The factor itself may be made up of a variety of factors that create differences between gross and net savings, commonly including estimated free riders and spillover. Other adjustments may include a correction factor to account for errors within the project tracking data, breakage, and other factors that may be estimated which relate the gross savings to the net effect of the program. Can be applied separately to either energy or demand savings.

**Potential Studies** - Studies conducted to assess market baselines and future savings that may be expected for different technologies and customer markets over a specified time horizon. Potential is typically defined in terms of 1) technical potential - savings estimate based solely on currently and anticipated available technology; 2) achievable potential - savings estimate based on market forces, codes and standards, equipment efficiency, and energy efficiency programs; and 3) economic potential - estimate of savings limited by only those found to be cost-effective.

**Process Evaluation** - A systematic assessment of an energy efficiency program for the purposes of documenting program operations at the time of the examination and identifying and recommending improvements to increase the program’s efficiency or effectiveness for acquiring energy resources, while maintaining high levels of participant satisfaction.

**Technical Potential** - An estimate of energy savings based on the assumption that all existing equipment or measures will be replaced with the most efficient equipment or measure that is technically feasible over a defined time horizon, without regard to cost or market acceptance.
